Phil Price  
Ford Motor Company

June 1, 2010

# Contents

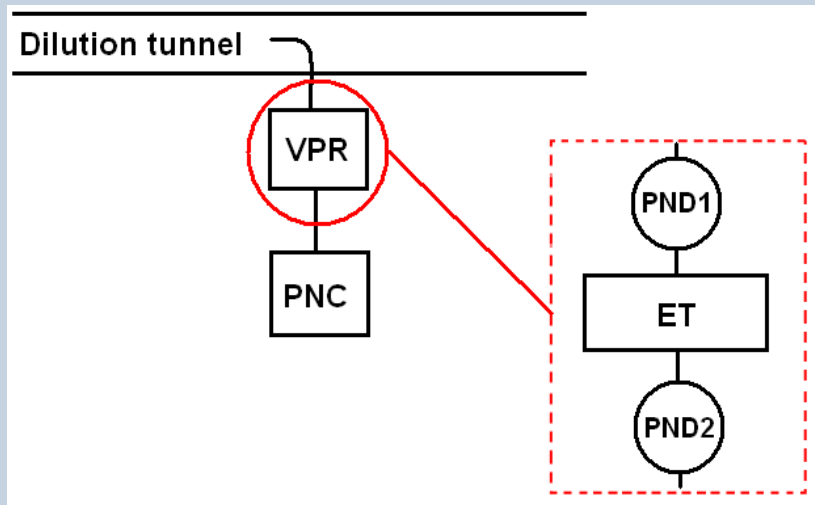

- **Motivation for the project.**
- **Method.**
- **Use of the DMS500 as a development tool.**
- **Solid particle measurements (dilution tunnel sampling).**
- **Solid particle measurements (tailpipe sampling).**
- **Conclusions.**

# Motivation

1. **DMS500 useful development tool for engine test cells and vehicle test cells without a dilution tunnel (fast time response, particle size, discrimination of nucleation and accumulation modes).**
2. **but can the DMS500 provide a solid Particle Number (PN) count comparable to a regulation compliant counter?**
3. **...i.e. can the DMS500 mode-fitting software accurately distinguish between solid and volatile particles? What are the limitations?**

# Solid and volatile particle discrimination

## Regulation compliant counter

R-83 (2009), "Uniform provisions concerning the approval of vehicles with regard to the emission of pollutants according to the engine fuel requirements"

## DMS500

Symonds *et al.* (2007), "Diesel soot mass calculation in real-time with a differential mobility spectrometer", *Journal of Aerosol Science* **38**(1), 52-68.

# Count efficiency correction

50% count efficiency:  $D_{50} = 23 \text{ nm}$   
 >90% count efficiency:  $D_{90} = 41 \text{ nm}$

## Regulation compliant counter

## DMS500

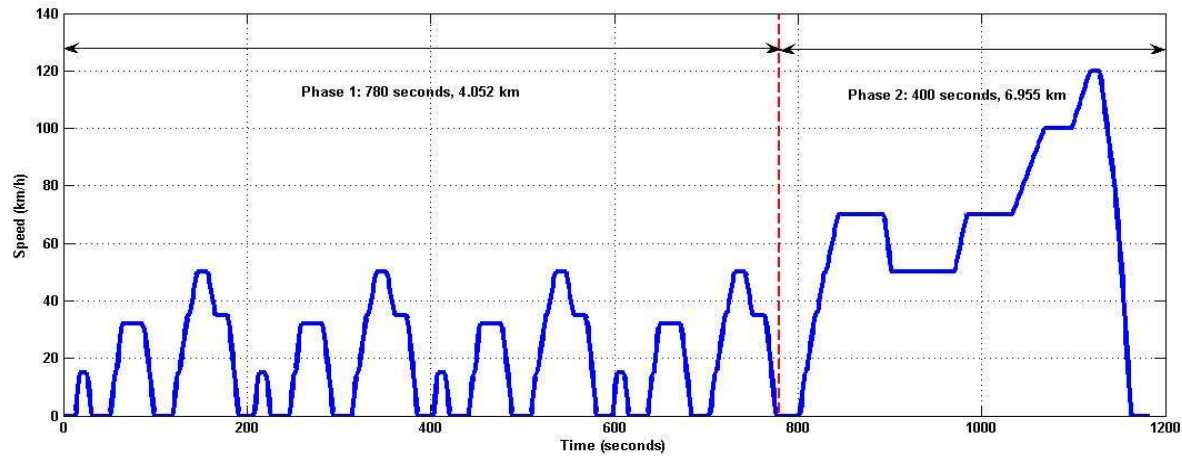

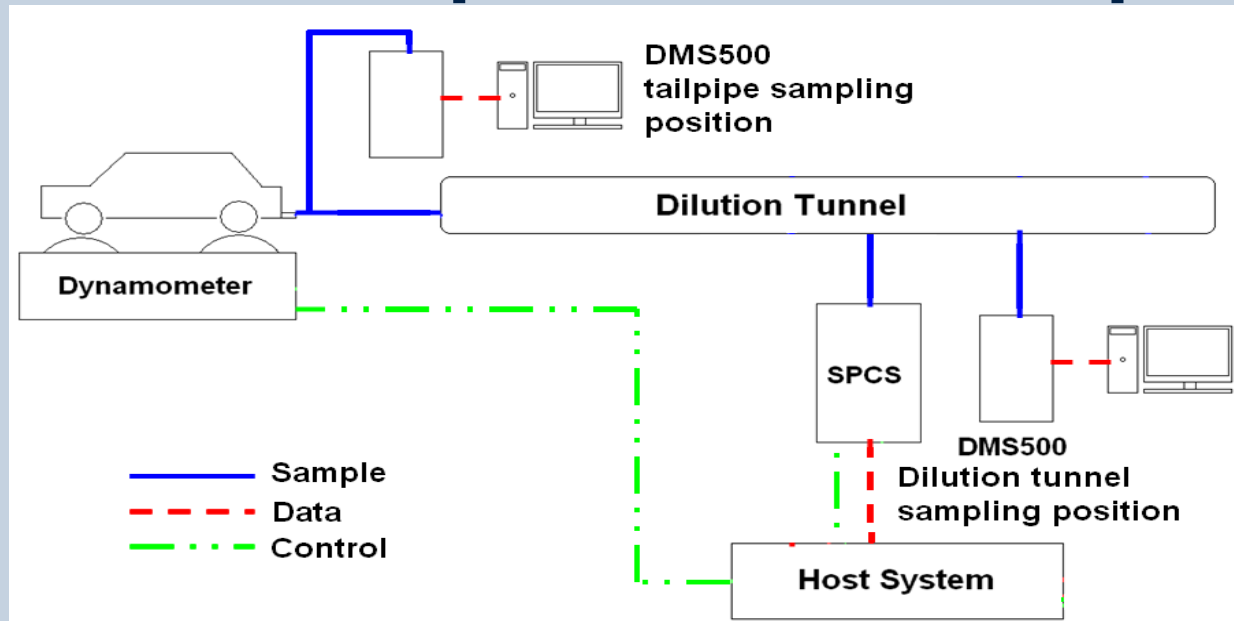

TSI (2007), “Model CPC-100 Condensation Particle Counter Operation and Service Manual”, P/N 1980553, Revision C. TSI Inc.

$$f = 1 - \exp \left[ -3.54 \left( \frac{d_p - 14}{40} \right)^{1.09} \right]$$

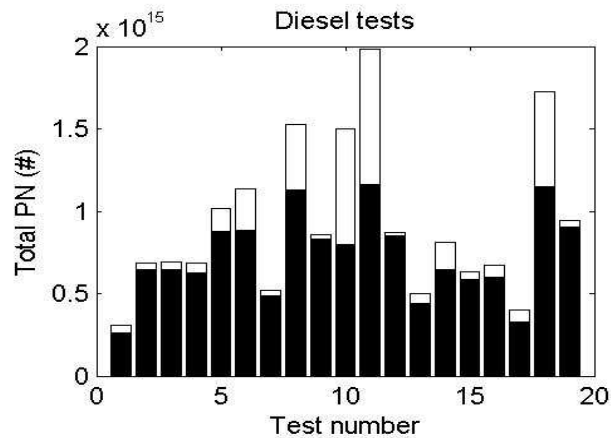

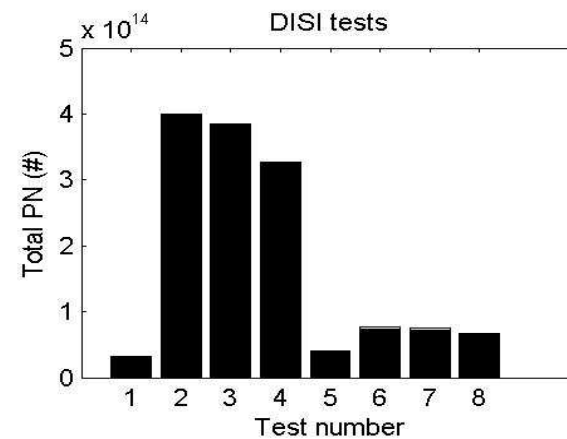

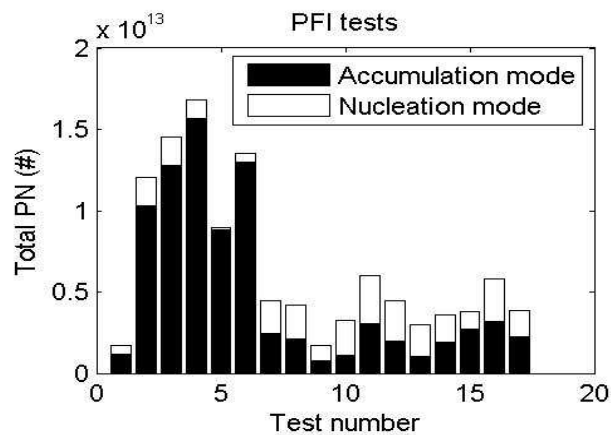

# Vehicles on test

<b>Vehicle Description</b>	<b>Fuel Injection Equipment</b>	<b>Induction Strategy</b>	<b>Exhaust After-treatment</b>
<b>Gasoline PFI</b>	Multi-point, Port Fuel Injection	Naturally aspirated	3-way catalyst
<b>Gasoline DISI</b>	Spray-Guided Direct Injection	Naturally aspirated	3-way catalyst
	Wall-Guided Direct Injection	Naturally aspirated	3-way catalyst, lean NOx trap
<b>Diesel DPF</b>	High pressure common rail	Turbocharged	Diesel oxidation catalyst, wall-flow Diesel Particulate Filter
<b>Diesel Non-DPF</b>	High pressure common rail	Turbocharged	Diesel oxidation catalyst

# Experimental set-up

# DMS500 as a development tool: Accumulation and nucleation mode data

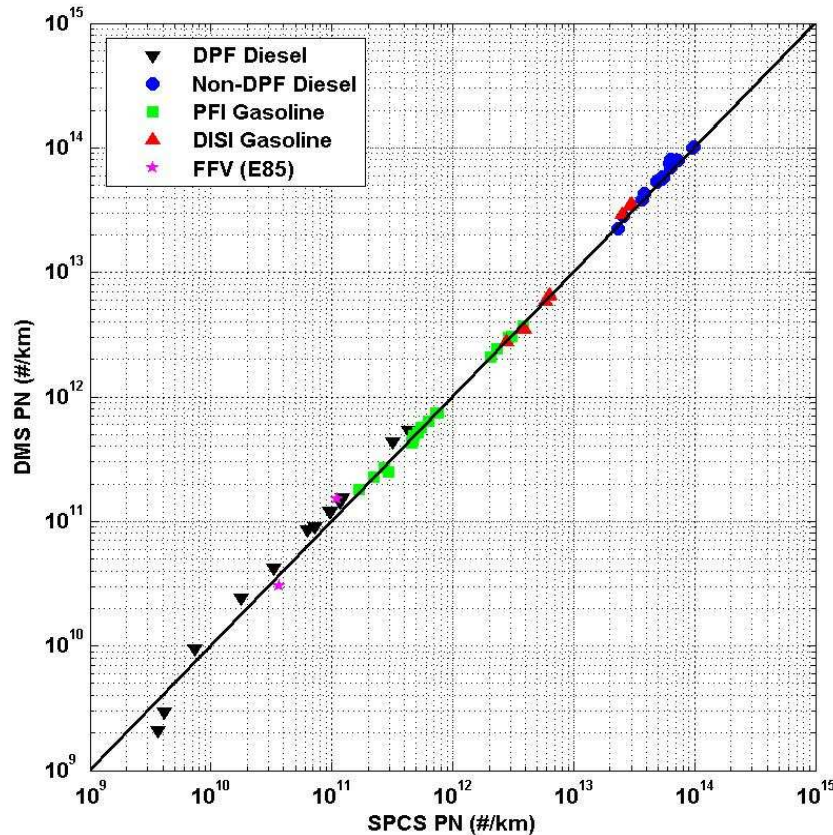

# DMS500 as a development tool: accumulation mode particle size

# Dilution tunnel solid PN measurement results: DMS500 accumulation mode versus SPCS

Diesel test

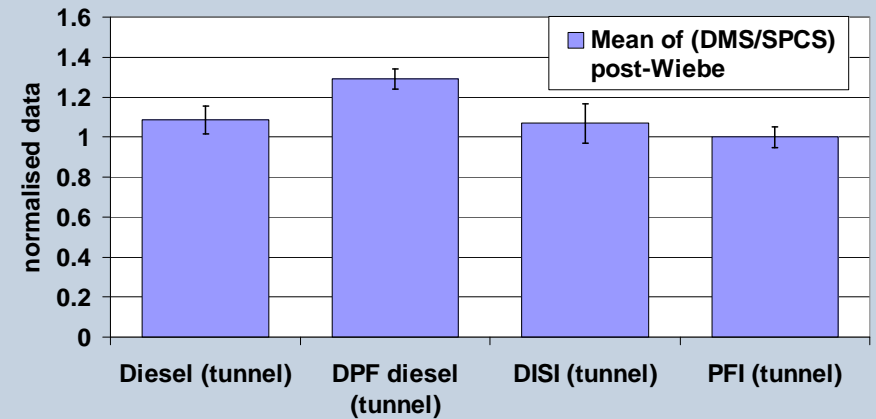

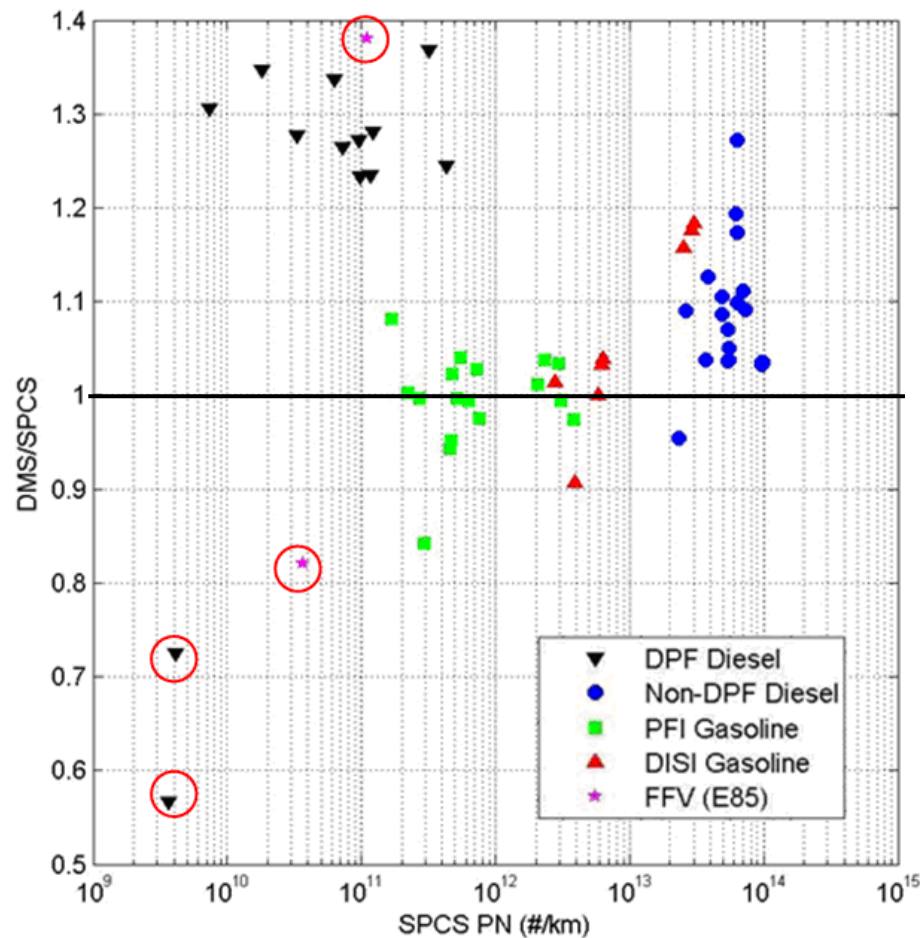

DPF diesel test

PFI PN data taken over Part 1 of the NEDC only.

# Dilution tunnel DMS500:SPCS solid PN comparison

Vehicle type	Mean	Standard deviation
Diesel (tunnel)	1.086	0.071
DPF diesel (tunnel)*	1.29	0.05
DISI (tunnel)	1.07	0.099
PFI (tunnel)	1.00	0.052

\*Excluding two outliers

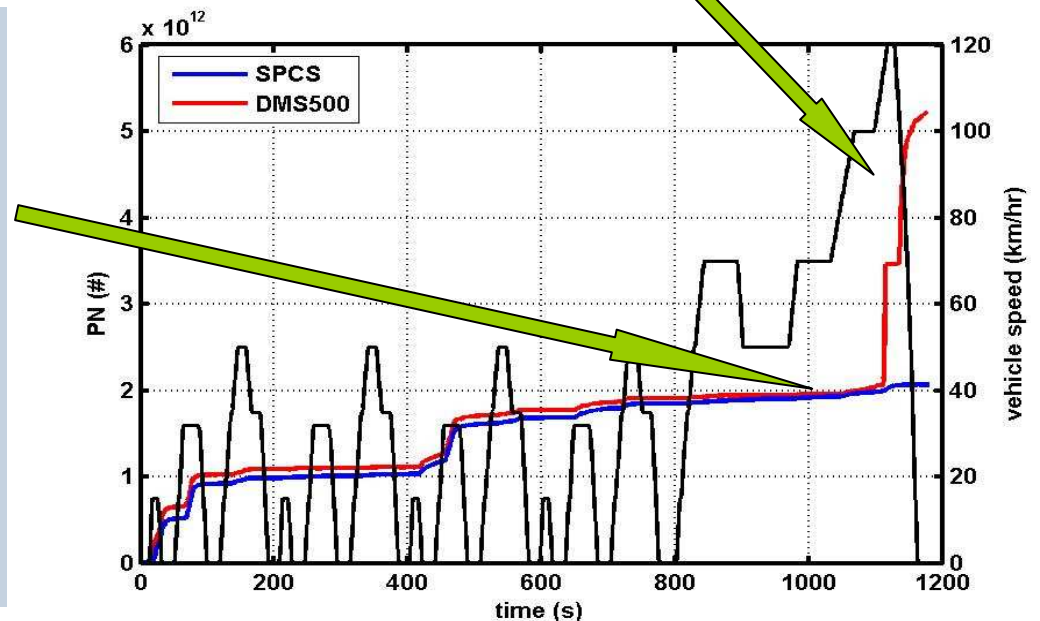

# Limitation 1: Silicone transfer hose

Emitted only during part 2 of the NEDC and only found to be of significance for PFI (gasoline + E85) vehicles.

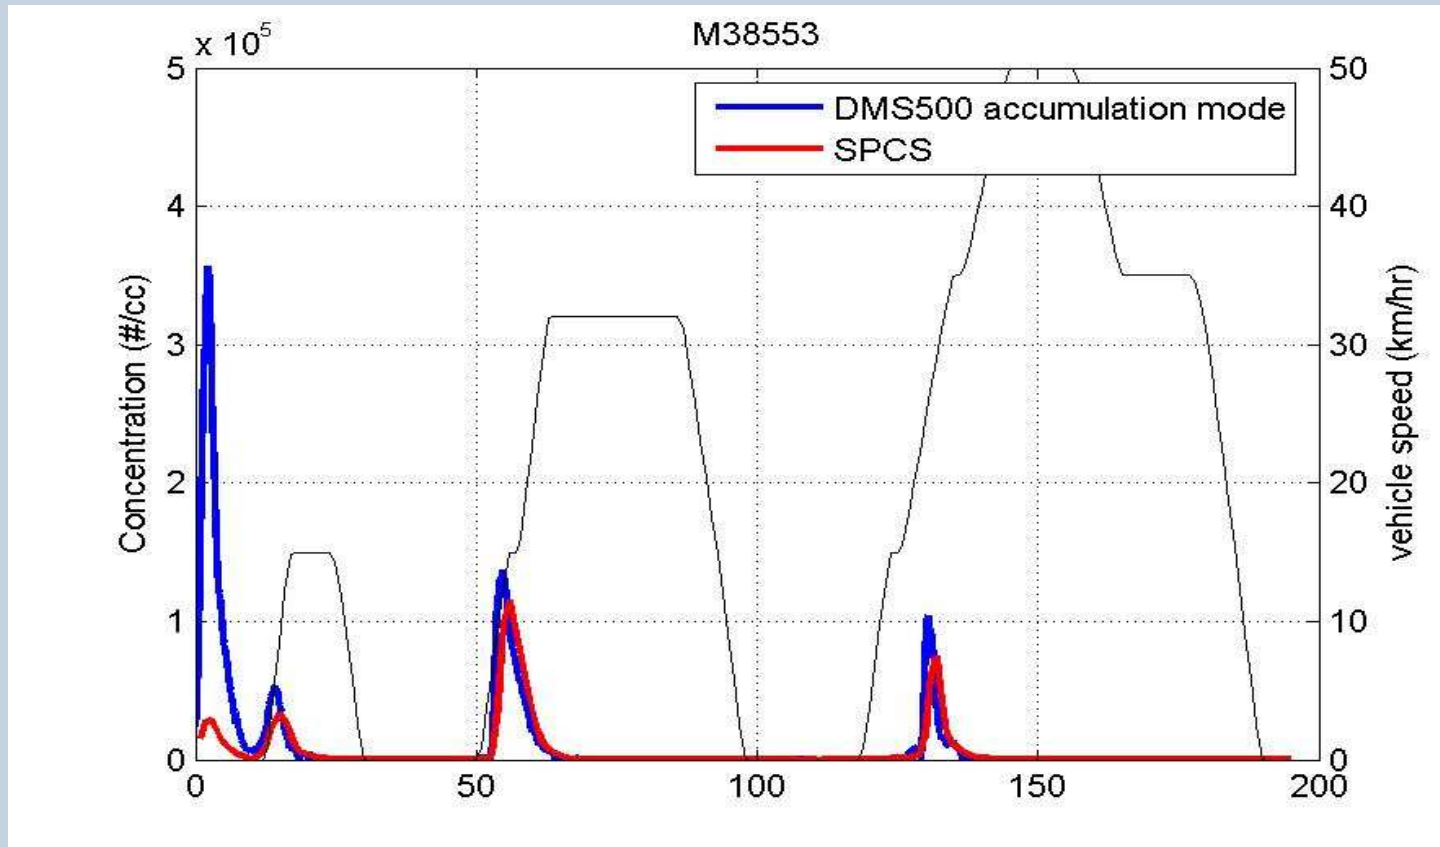

SPCS counter insensitive to these particles. DMS500 accumulation mode not.

PFI PN data therefore only represented over part 1 of the NEDC.

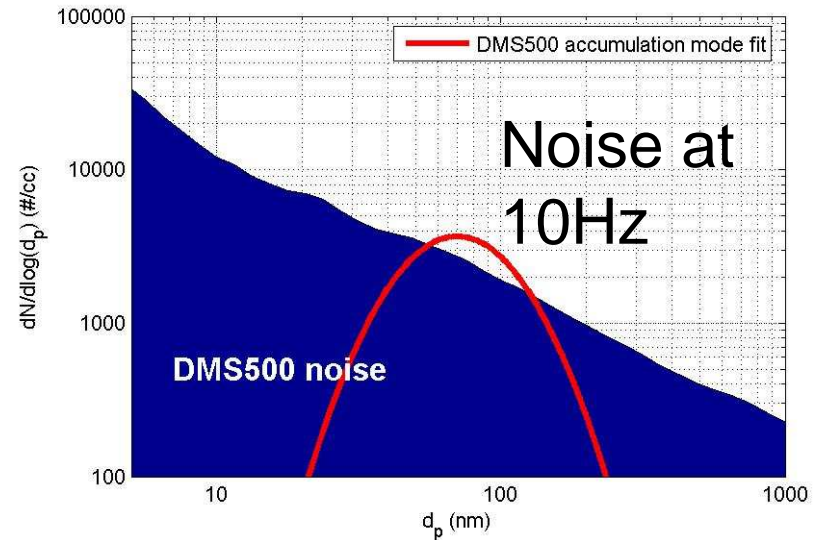

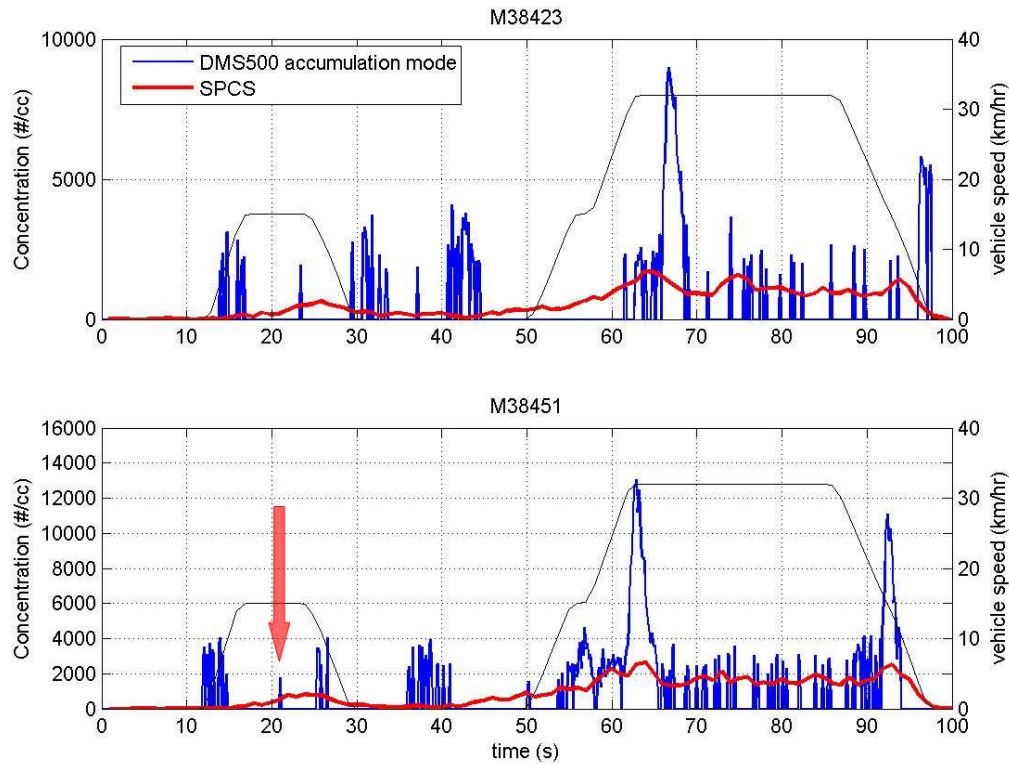

Can 'produce' up to  $3 \times 10^{11}$  particles per km.

## Limitation 2: Cold-start E85 fuel

High accumulation mode concentration during cranking. SPCS demonstrates it is not solid particulate matter. Condensed ethanol droplets in the accumulation mode?

# Limitation 3: Low Signal-to-Noise Ratio

PN emission rate  $< 4 \times 10^9$  per km.

# Tailpipe solid PN measurement results: DMS500 accumulation mode versus SPCS

**Limited data set, but indicates good instrument-to-instrument agreement.**

# Tailpipe DMS500:SPCS solid PN comparison

*Does the solid PN agreement hold when sampling directly from the tailpipe with the DMS500?*

## DMS500/SPCS results

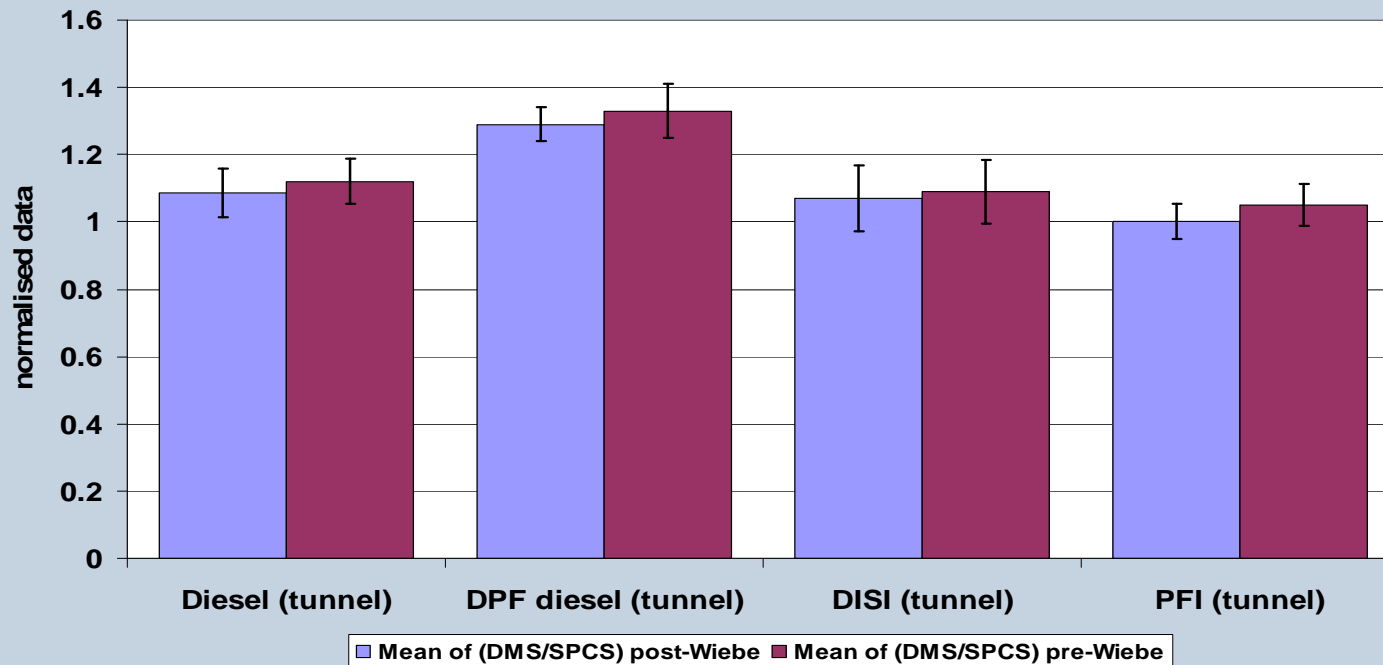

Vehicle type	Mean	Standard deviation
Tunnel (Diesel)	1.086	0.071
Tunnel (DPF diesel*)	1.29	0.05
Tunnel (DISI)	1.07	0.099
Tunnel (PFI)	1.00	0.052
Tailpipe (All vehicles)	0.88	0.23

\*Excluding two outliers

# Effect of Wiebe function on DMS500 solid PN measurements

*Was applying the Wiebe function to the DMS500 accumulation mode PN data necessary?*

Slightly improved agreement between DMS500 solid PN and SPCS PN with Wiebe function. Extra data processing required.

# Conclusions (1/2)

- DMS500 has been demonstrated to be a useful development tool:
  - PFI and diesel vehicles most likely to provide a significant nucleation mode.
  - Differences in particle size observed for 2 different types of DPFs
- DMS500 accumulation mode demonstrated to successfully correlate with solid PN results from a regulation-compliant counter, when sampling either from the dilution tunnel or tailpipe.

## Conclusions (2/2)

- Accumulation mode, however, can be prone to non-solid particles:
  - Silicone particles
  - Ethanol droplets
- At a PN emission rate of  $< 4 \times 10^9$  per km, the DMS500 appeared to be on the SNR limit (at 10Hz). However, measurements were taken with a mk1 DMS500. Latest units have 3x sensitivity. Suggested that data is logged at 1Hz for DPF-diesel tests to improve SNR.
- Wiebe function, for count efficiency correction, has been shown to slightly improve solid PN agreement, but probably does not warrant extra data processing required.

**Thank you for listening. Any Questions?**
