# Aerosol particle light absorption: bringing metrology to black carbon measurements

**Paul Quincey**

**Gas and Particle Metrology Group**

**Cambridge Particle Meeting**

**15<sup>th</sup> June 2018**

# What do we mean by black carbon ?

## In principle:

**Black carbon (BC)** is a useful *qualitative description* when referring to *light-absorbing carbonaceous* substances in atmospheric aerosol; however, for quantitative applications the term requires clarification of the underlying determination  
*[my italics]*

**Equivalent black carbon (EBC)** should be used instead of black carbon for data derived from optical absorption methods, together with a suitable mass-specific absorption cross-section (MAC) for the conversion of light absorption coefficient into mass concentration.

[A. Petzold et al., “Recommendations for reporting black carbon measurements”, Atmos. Chem. Phys., 13, 8365-8379, 2013]

# What do we mean by black carbon ?

## In practice:

(E)BC is an optical measure of airborne “soot” that can be made with:

- high sensitivity
- high time resolution
- simple, reliable instruments

# Black carbon basics

1 Aerosol optical absorption, **filter-free**. Unit  $\text{Mm}^{-1}$   
→ **equivalent black carbon**  $\mu\text{g}/\text{m}^3$   
*using a conventional mass absorption cross-section,*  
*e.g.  $7.5 \text{ m}^2/\text{g}$*

2 Aerosol optical absorption, **filter-based**. Unit  $\text{Mm}^{-1}$   
→ **equivalent black carbon**  $\mu\text{g}/\text{m}^3$   
*using a conventional mass absorption cross-section*  
*and an empirical correction for filter effects*

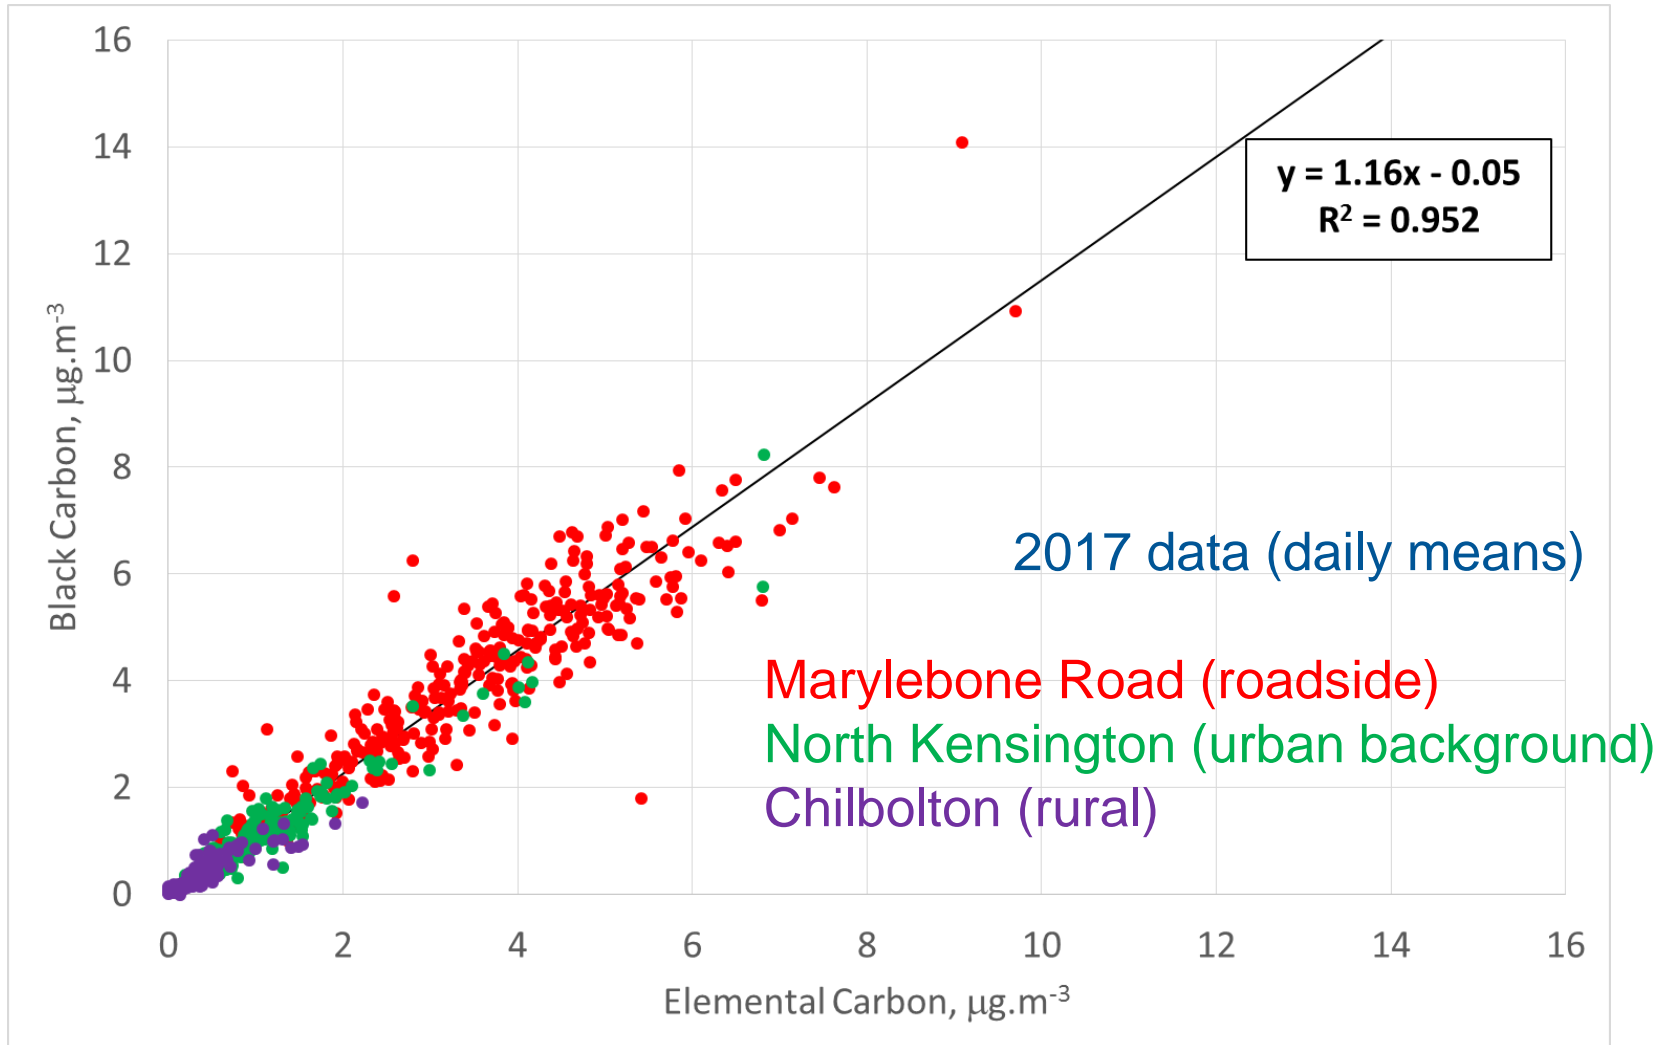

“True” black carbon needs additional correction for:

enhanced absorption by internally-mixed non-absorbing material,  
absorption by non-carbonaceous material,  
particle size etc.

Directly relevant to climate change;

rapid and sensitive indicator of primary combustion sources for air quality and atmospheric science

# Relation between Black Carbon and Elemental Carbon in ambient air

Data from the Defra Black Carbon network and the Defra Particles network, run by NPL with King's College London

# Relation between BC and EC in the London Underground

## PM<sub>2.5</sub> inlets

High Fe concentration  
**BC overestimated**

Large (non-combustion)  
graphitic particles  
**BC underestimated**

# Relation between BC and EC in the London Underground

**TSP inlets**  
**(no size selection)**

High Fe concentration  
**BC overestimated**

Large (non-combustion)  
graphitic particles  
**BC underestimated**

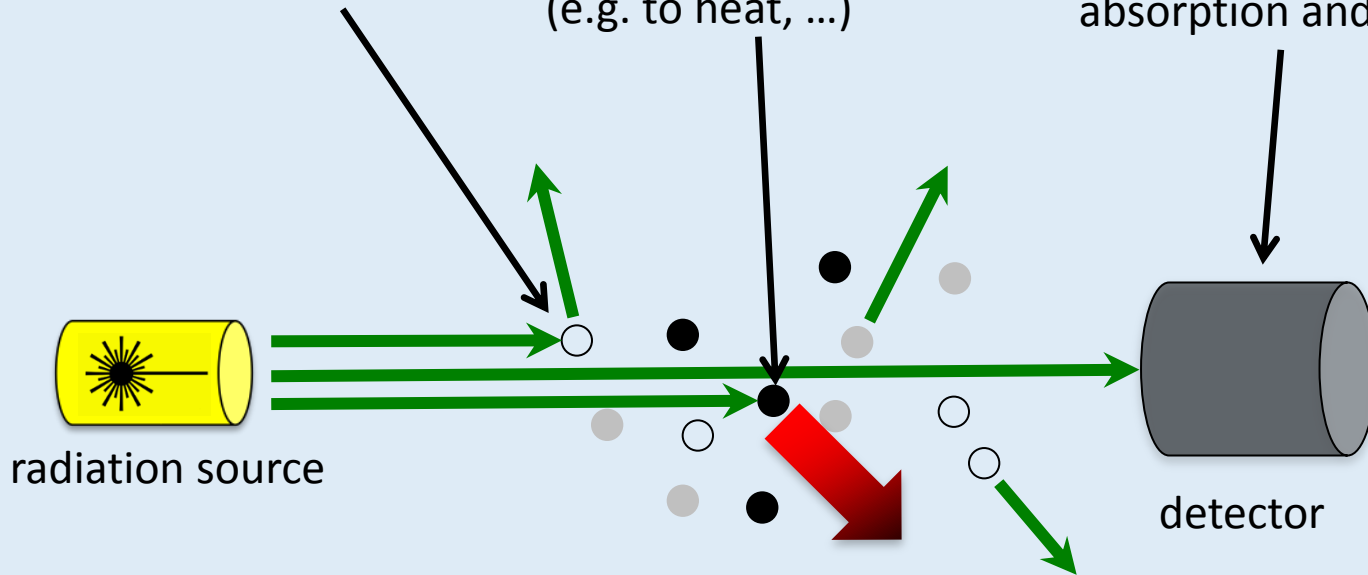

# **FILTER-FREE aerosol light absorption**

scattering + absorption = extinction

light is scattered  
in other directions

light is absorbed  
and transformed  
(e.g. to heat, ...)

light is attenuated  
(extinction) due to  
absorption and scattering

**Direct: photoacoustic or  
photothermal interferometry**

**Indirect: extinction minus  
scattering**

**EMPIR  
BLACK  
CARBON**

# **FILTER-FREE aerosol light absorption**

scattering + absorption = extinction

light is scattered  
in other directions

light is absorbed  
and transformed  
(e.g. to heat, ...)

light is attenuated  
(extinction) due to  
absorption and scattering

$$I_1/I_0 = e^{-\alpha x}$$

**Direct: photoacoustic or  
photothermal interferometry**

**Traceability to  
SI is possible**

**Indirect: extinction minus  
scattering**

**EMPIR  
BLACK  
CARBON**

# **FILTER-FREE aerosol light absorption**

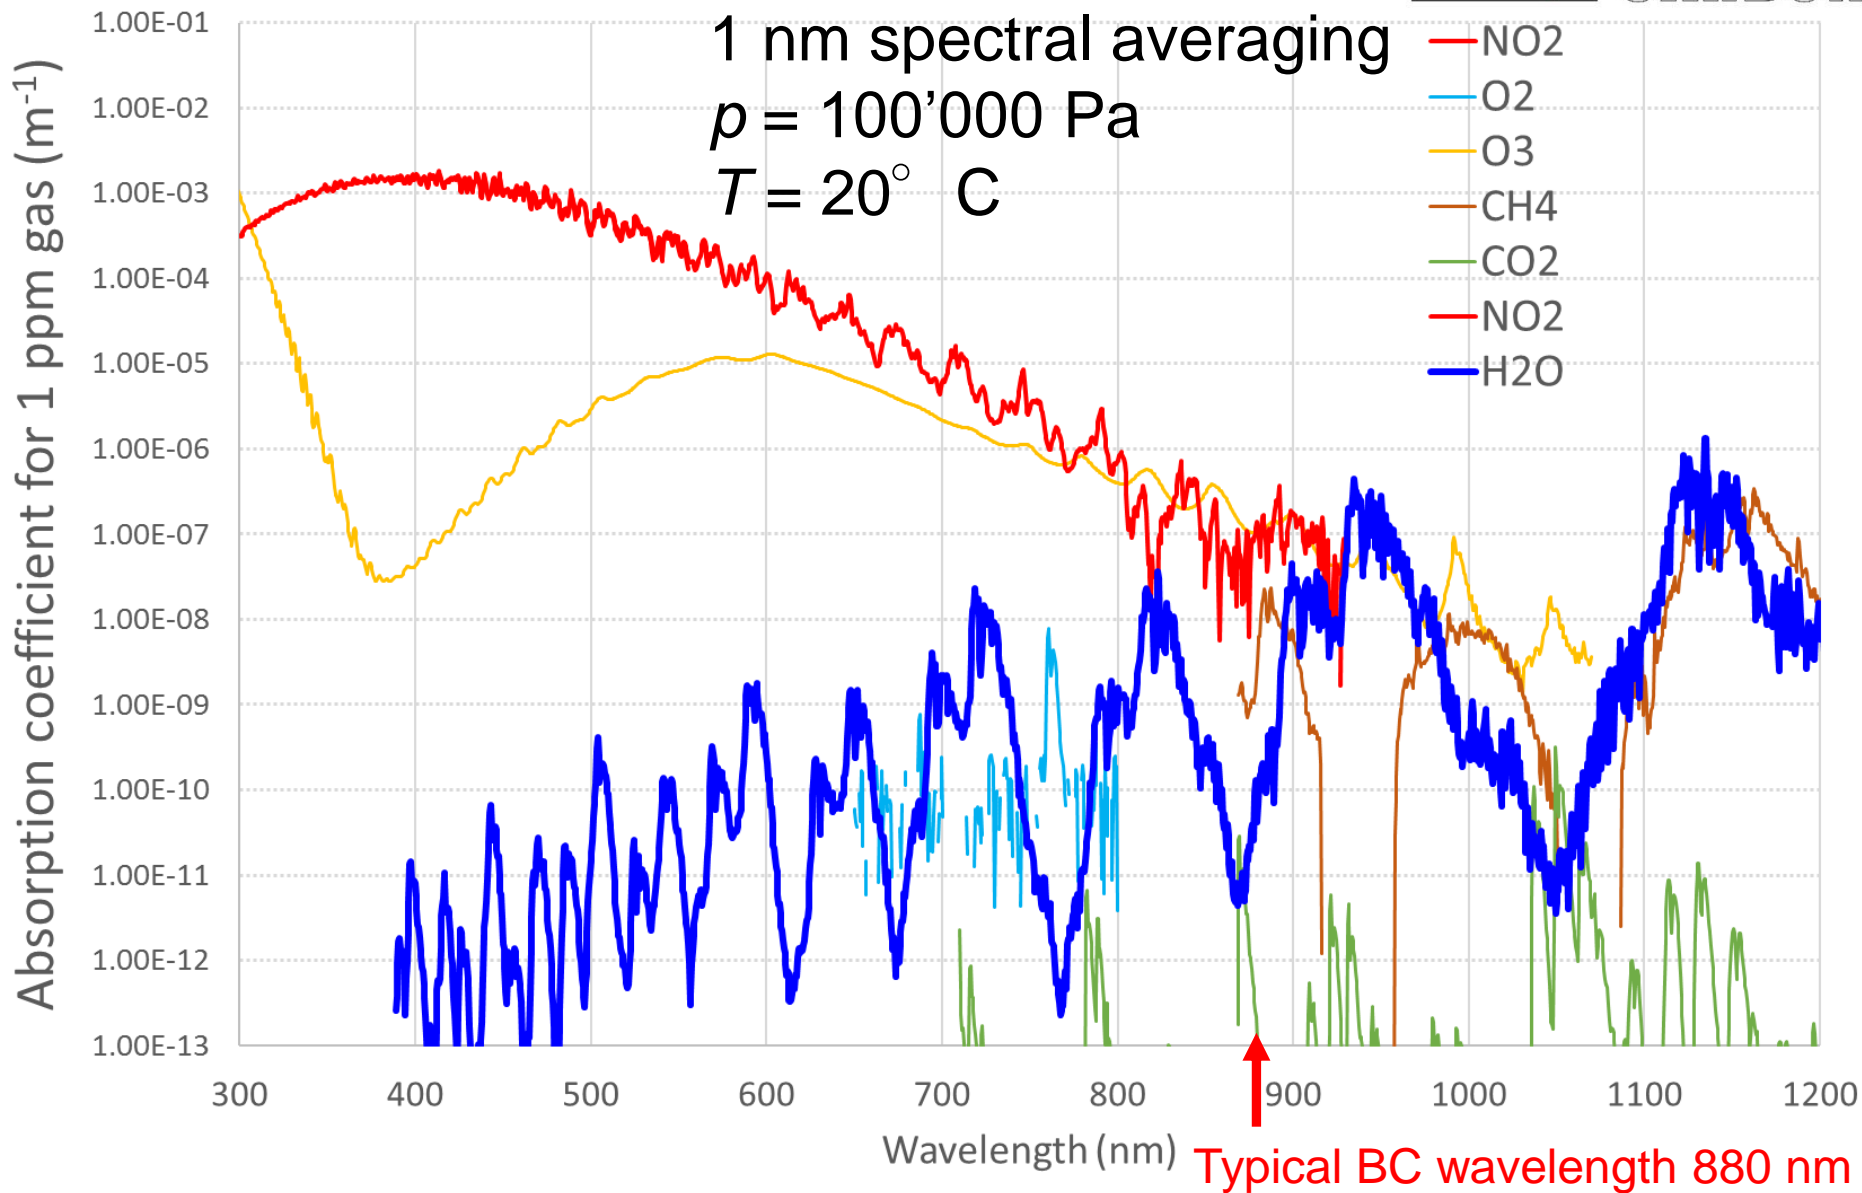

Uncertainty components include

Gaseous absorption (and scattering)

**EMPIR**  
**BLACK**  
CARBON

# Absorption data for 1 ppm of various gases (slide courtesy of Ernest Weingartner, FHNW)

## **FILTER-FREE aerosol light absorption**

Uncertainty components include

Gaseous absorption (and scattering)

Mainly by  $\text{H}_2\text{O}$ , but also by  $\text{NO}_2$  and  $\text{O}_3$ .

Are there benefits of moving reference instrument measurements to 770 nm (or another “water window” wavelength), so that any correction is minimised?

# **FILTER-BASED aerosol light absorption instruments**

scattering + absorption = extinction

by the filter and a “sheet” of particles; affected by loading, particle mix and filter type

enhanced by internal reflections; affected by loading, particle mix and filter type

light is attenuated (extinction) due to absorption and scattering

e.g. aethalometer, MAAP, PSAP

Gaseous absorption is relatively unimportant

**EMPIR**  
**BLACK**  
**CARBON**

## **FILTER-BASED aerosol light absorption instruments**

The determination of aerosol absorption is affected by different filter types,

*and by different particle types for each type of filter.*

It is **not** possible to apply a general calibration factor (**traceability**)

But it **is** possible to apply a calibration factor for specific particle types (**standardisation**)

# Overall plan

High accuracy  
SI-traceable  
filter-free  
methods

Potentially  
improved filter-free  
field instruments

Aerosol sources  
characterised by  
SI-traceable  
methods

Traceable  
calibration methods  
for filter-based field  
instruments

## **FILTER-BASED aerosol light absorption instruments –**

## **What particles to use for calibration ?**

“Pure black carbon” particles would lead to instruments giving the wrong answer with ambient air.

Two “extreme” particle types, representative of ambient air, are needed, to avoid accidental accuracy.

Key properties:

particle size (affecting penetration into the filter)

Single Scattering Albedo (ratio of scattering to extinction)

# **FILTER-BASED aerosol light absorption instruments –**

## **What particles to use for calibration ?**

We propose two types of calibration aerosol:

- (1) “fresh combustion particles”:  
size 50 - 100 nm, SSA 0.4 – 0.6 at 550 nm
  
- (2) “aged combustion particles”:  
size 200 - 400 nm, SSA 0.7 – 0.9 at 550 nm.

In both cases, the absorption coefficient should cover the range from 0 to 50  $\text{Mm}^{-1}$  at 880 nm.

# Potential calibration sources: coated and uncoated soot

Photo-oxidation reactor (micro smog chamber)

1st quartz tube (surrounded by 5 mercury lamps) -> production of  $O_3$  by UVC light (up to 100 ppm)

2nd quartz tube (UVA, optional, for production of  $\cdot OH$ )

# EMPIR Black Carbon project
